

Personnel Carrier

Personnel Carrier - There is a large variety of leaf chains which are utilized in the material handling business across the world. Some functions may comprise use on certain saddle carriers and forklift trucks. Top quality leaf chain is complete with distinctive design features such as maximum wear resistance, long life service, compact design and high fatigue strength.

Link plates are constructed out of highly specialized steel which could deliver maximum resistance to breakage while withstanding sudden heavy cargo.

Made especially out of strong steel, bearing pins bring exceptional bending resistance thus extending the wear life of the chain.

Inner plate movement is enhanced by close control of the plate hole and pin dimensions. When friction is reduced to bare minimum, the chain can work more efficiently and economically.

Pitch is the distance between each and every plate hole or pin. Pin hole diameters and pitch accuracy, that are the holes in link plates, is strictly maintained on each and every component through their construction. This attention to part detail ensures an accurate operation and consistent movement of the leaf chain joints.
